EACH TABLET CONTAINS: 25 mg acepromazine maleate.

INDICATIONS: As an aid in tranquilization and as a preanesthetic agent in dogs.

DOSAGE: Dogs - 0.25–1.0 mg per lb of body weight. Dosage may be repeated as required.

Refer to folded package insert attached to this container for complete product information.

STORAGE: Store at 20° to 25°C (68° to 77°F), excursions permitted between 15° and 30°C (between 59° and 86°F). Keep out of reach of children.

INDICATIONS: As an aid in tranquilization and as a preanesthetic agent in dogs.

Acepromazine Maleate Tablets can be used as an aid in controlling intractable animals during examination, treatment, grooming, x-ray and minor surgical procedures.

DOSAGE AND ADMINISTRATION:

Dogs: 0.25-1.0 mg/lb of body weight. Dosage may be repeated as required.

ANIMAL SAFETY:

Acute and chronic toxicity studies have shown a very low order of toxicity for acepromazine maleate. A safety study using elevated dosages of acepromazine maleate demonstrated no adverse reactions even when administered at three times the upper limit of the recommended daily dosage (3.0 mg/kg body weight). The clinical observation for this high dosage was mild depression which disappeared in most dogs 24 hours after termination of dosing.

The only occurrence of adverse reaction during numerous clinical trials was a very mild respiratory distress (reverse sneeze) which was transient in nature and had no effect on the desired action of the drug.

CONTRAINDICATIONS: Phenothiazines may potentiate the toxicity of organophosphates. Therefore, do not use acepromazine maleate to control tremors associated with organophosphate poisoning.

Do not use in conjunction with organophosphorus vermicides or ectoparasiticides, including flea collars.

Do not use with procaine hydrochloride.

WARNING: Do not use in animals intended for human consumption.

PRECAUTIONS: Tranquilizers are potent central nervous system depressants, and they can cause marked sedation with depression of the sympathetic nervous system. Tranquilizers can produce prolonged depression or motor restlessness when given in excessive amounts or when given to sensitive animals. Tranquilizers are additive in action to the actions of other depressants and will potentiate general anesthesia. Tranquilizers should be administered in smaller doses and with greater care during general anesthesia and also to animals exhibiting symptoms of stress, debilitation, cardiac disease, sympathetic blockade, hypovolemia or shock.

Acepromazine, like other phenothiazine derivatives, is detoxified in the liver; therefore, it should be used with caution on animals with a previous history of liver dysfunction or leukopenia.

Epinephrine is contraindicated for treatment of acute hypotension produced by phenothiazine-derivative tranquilizers since further depression of blood pressure can occur.

Phenothiazines should be used with caution when followed by epidural anesthetic procedures because they may potentiate the arterial hypotensive effects of local anesthetics.

ADVERSE REACTIONS: A few rare but serious occurrences of idiosyncratic reactions to acepromazine may occur in dogs following oral or parenteral administration. These potentially serious adverse reactions include behavioral disorders in dogs such as aggression, biting/chewing, and nervousness.

To report suspected adverse reactions, to obtain a Material Safety Data Sheet or for technical assistance, call 1-866-638-2226.
